Power Quality information (10)

Power quality information shall contain data on: **a) all power quality investigations conducted in the past year for industrial customers who have requested a power quality investigation as a result of an event originating from utility equipment; and** **b) power quality investigations conducted in the past year into any power quality event. For purposes of this form, a power quality event is defined as an event that affected customers on a single circuit or substation; resulted in damage to customer appliances, equipment, or wiring; and occurred within a 24-hour period. (Can be put on a separate page or pages.)**	See Appendix 4

DEFINITIONS AND NOTES

(1) "Total customer credits" means the dollar amount of customer credits provided on customer bills during the year.

(2) "Location of Circuit - zip codes" refers to the zip codes where spans of the circuit are located.

(3) "Last circuit trim (year)" is the last year there was trimming on the circuit as part of a normal tree trim cycle (not reactive trimming)

(4) "List of outages and causes" - please discuss outages that meet the definition of a "major interrupton" as defined by R 460.3102(j)

(5) For CEMI0 through CEMI10+ reporting, please provide percentages. Reporting should be all conditions.

(6) For CELID reporting, please provide percentages. Reporting should be all conditions and follow the definition of CELID Single Interruption Duration per IEEE 1366-2022 section 4.2.8. Do not double count multiple outages of that fall within the same time bracket. For example, a customer experiencing two nine-hour outages should only be reported once in CELID8hrs. Longer outages may qualify for inclusion in multiple CELID metrics. For example, a customer experiencing a 30-hour outage may be reported in CELID8hrs and CELID24hrs.

(7) For the worst performing circuits sections, SAIDI and SAIFI should be calculated on a system basis. Worst performing circuits operated by utilities and cooperatives with less 1,000,000 customers should not be compared to worst performing circuits that are operated by utilities with 1,000,000 or more customers.

(8) For the worst performing circuits sections, a circuit is defined as a substation feeder or line exit from a substation serving at least 10 metered customers.

(9) The system-wide SAIDI, SAIFI, and CAIDI data is requested pursuant to MCL 460.55 and the July 7, 2023 order in Case No. U-12270.

(10) Power quality information is being requested pursuant to the July 7, 2023 order in Case No. U-12270.

(11) Major event day, or MED, is defined according to IEEE 1366-2022.

* A customer shall be defined as a "metered electric service."

** Interruptions that occur as a result of outages on customer-owned facilities, or loss of supply from another utility, should not be included in IEEE reliability index calculations.

Appendix 1 - Actions to Improve Reliability Performance

In 2025, the performance of the Company's system missed one Service Quality and Reliability metric: CEMI4. The metrics are reported in the standard template.

The Company will be filing a comprehensive Distribution System Plan in 2026 to present DTE's strategy to modernize and strengthen the grid with a portfolio of both near- and longer-term initiatives. This plan will explain the investments which will improve both reliability and safety for our customers and improve performance relative to the Service Quality and Reliability Standards' metrics. The plan will reduce the frequency of outages, both in the face of severe weather and in normal conditions, improving on the metric missed in 2025.

In general, the goals of the investments over the next five years are to:

- Maintain the foundational defensive layer through the Vegetation and System Maintenance pillar, which will protect and enhance the reliability improvements achieved in recent years by reducing exposure to tree-related outages and maintaining the health of existing infrastructure through preventative and corrective maintenance.
- Remove structural weaknesses and harden vulnerable segments of the grid through the Resilience and Hardening pillar, including increasing the frequency of pole and pole top inspections as part of the Pole and Pole Top Maintenance programs to achieve a 10-year pole and 5-year pole top cycle, in alignment with recommendations from the Liberty Audit, and targeting equipment replacements to address known failure modes.
- Redesign and Modernization investments will address constraints from legacy infrastructure and create more efficient long-term solutions. Within this pillar the Company will continue to modernize the grid through substation and circuit voltage conversion projects and subtransmission upgrades to improve reliability by replacing end of life equipment; installing the latest automation technology, which will improve safety by eliminating energized wiredowns; and adding capacity for DERs and electrification.
- Technology and Automation pillar investments will increase the level of automated restorations (smart grid technology) by adding sectionalizing devices (reclosers) and tie points to circuits to the system to reduce the size and duration of customer outages, making the grid a smarter one.
- Additionally, the Company will invest in a pillar focused on Grid Edge and Distributed intelligence, which will work in concert with other investments to unlock more value from automation and extend visibility and control further into the grid.

Appendix 4 – Power Quality Resolution Process

Power Quality Inquiry Process

DTE Electric (DTE) has a proven effective process in place that enables its large industrial and commercial customers typically served off the sub-transmission or transmission system to obtain resolution of power quality issues. The customers contact their assigned account representative who in turn starts the process of helping the customer by engaging the appropriate engineer in Distribution Operations. DTE and ITC Transmission (ITCT) have a very successful process concerning the transmission system events.

The response to the customer normally includes the following steps:

(1) Obtain pertinent information about what is troubling the customer (old or new equipment, one device or many).
(2) Gather the dates and times from the customer to correlate with EMS Alarm Logger events (cap switching, line trips).
(3) Correlate the customer's experiences with the power quality meters at the service point or with power quality meters in the area.
(4) Meet with the customer about the correlation of system and customer events.

Based on the correlation of DTE and customer events, the following outcomes or additional steps are possible:

(1) Special power quality monitoring (DTE or customer) could be installed to determine customer equipment sensitivity and source of problem.
(2) Customer conducts site survey to determine if his operating voltage is optimal.
(3) Trouble with minor sags from DTE system (sensitive equipment) - customer's responsibility to make compatible.
(4) Internal system trouble - customer's responsibility to make equipment compatible.
(5) ITCT/DTE will seek resolution of problems caused on the ITCT/DTE systems where the customer equipment wouldn't be expected to have ride-through to significant voltage sags. The rate of occurrence, system exposure and service method determine if remedies are commercially feasible.

Power Quality Monitoring

DTE has an array of power quality meters across its system at key industrial, sub-transmission, and distribution buses that have proven to be very effective. New meters are installed at new or upgraded industrial substations and on sub-transmission buses.

The power quality meters at the industrial locations allow DTE to correlate the recorded voltage sags with system events from the SCADA-EMS system. This system provides DTE with information unique to the customer and a tool to track the performance of the system. The system performance data is used to prioritize capital improvements and system maintenance.

The power quality meters on the sub-transmission and distribution buses provide system performance data. This information will reduce the time and cost to find causes of voltage sags and facilitate repair the system when necessary.

Also, voltage sags on the DTE system can be correlated with faults on the ITCT system. The DTE power quality data may be shared with ITCT to evaluate customer power quality issues.

The number of locations impacted by customer inquiries was 50 during 2025. Through the end of 2025, there have been over 400 ION 8650 power quality meters installed at Industrial Substation customer sites throughout the system.

The follow-up investigations indicate that most of the customer inquiry events were due to either voltage sags (64%) and interruptions (36%) correlated with trouble occurring on the DTE (69%) systems, ITCT (1%) systems and customer equipment failure (30%).

Line clearance, system modifications such as operating practice changes, equipment replacement or maintenance, and adding animal guards/protection are all typical actions taken to reduce the occurrences of the events.
